Remote issue URL:	
Affected version:	
Description:	This is just a tweak that I've applied for my company's installation that I just wanted to see if anyone was interested in adding to ChiliProject.
	In order to make sub-projects for visible, instead of listing them all on one line, comma-separated, we've moved them into an unordered list with one sub-project per list-item. The list is also nested inside a "box" (div with class box). We've really liked this little tweak. I've attached a patch file for your perusal.
	If interested, let me know and I'll add a pull request on Github.

I like the idea of the change, to keep the "visual feel" I think I'd rather like the list to be formatted the same as the overall project list, could you see if that works?

- File tweak_project_overview.patch added

So I noticed that the project list on the project's index page uses a helper to render the project list. In order to keep the same visual feel, I played with simply using the same helper to render the sub-projects list (not longer in a box) on the project overview page.

I liked the change so much that I updated our installation to use this new display. I've included an updated patch file that contains my most recent update that attempts to implement Felix's recommendation.

Note: The patch includes an added method on the @Project@ class (@#all_visible_children@) and a tweak to the @ProjectsController#show@ method to use it. This was because I thought it'd also be nice to display the full hierarchy of nested sub-projects visible to the current user, not just the immediate children. I'd love feedback on this specific variant of this idea as well, both on the idea and on my implementation. I'm still new to the ChiliProject code base and don't want to duplicate effort or have too much of a mismatched style.
