Affected version:	
Description:	*In Development Environment, no known issue in Production Environment*

I am creating a plugin that would add journals to Version. When attempting to view activity or a user's page, the first view works fine, but a reload causes "Association :project not found". When I put my acts_as_journalized code in version.rb, the issue does not occur.

Code:

```
<pre>
module CoreUpdate
  module VersionPatch
    def self.included(base)
      base.class_eval do
        acts_as_journalized :event_title => Proc.new{|o| "Milestone Update ##{o.version}"},
          :event_description => Proc.new{|o|
          str=""
          o.details.each do |detail|
            str<<"#{o.render_detail(detail,true)}\n"
          end
          str
        },
          :event_url => nil,
          :activity_permission=>:manage_milestones
        end
      end
    end
  end
</pre>
```

I have also tried to use unloadable in the self.included and at the module level. No effect
