

ChiliProject - Bug # 1240: Sending notification fails

Status:	Closed	Priority:	Normal
Author:	Enderson Maia	Category:	
Created:	2013-02-19	Assignee:	
Updated:	2013-05-22	Due date:	
Remote issue URL:			
Affected version:	3.7.0		
Description:	I'm getting this message on the logs. <pre> ... Sending email notification to: endersonmaia@<OMITED> The following error occured while sending email notification: "Expected /var/www/chiliproject.production/app/models/version.rb to define VERSION". Check your configuration in config/configuration.yml. ... </pre> I've migrates chiliproject to another server, and now I'm getting this message. Everything in the chiliproject code are the same between deploys, just the database config is different. The different is in the ruby version, I'm using ruby 1.9.3-p385. I'm running the test suite right now to see if I get any clues.

Forget to mention about the log message.

I can't find anywhere that has a VERSION constant to be defined, or any reference to this constant.

2013-02-20 02:04 pm - Enderson Maia

THAT'S NOT THE CORRECT SOLUTION

When I added the constant VERSION in the file app/models/version.rb, I sovled the problem.

```
<pre>  
...  
VERSION = '0.1'  
class Version < ActiveRecord::Base  
...  
</pre>
```

I think it has something to do with load paths, but not figured the right way to solve it yet.

- Status changed from Open to Needs more information

This should definitely not be necessary. I suspect you have some plugins installed which mess with the load order. Please paste the full stack trace from the log. Also, please specify your ruby version and the complete list of your custom plugins.

- Status changed from *Needs more information* to *Closed*

I was using the Rails plugin `@action_mailer_optional_tls@`.

I removed `@vendor/plugins/action_mailer_optional_tls@`, and changed the `@config/configuration.yml@` :

```
<pre>
  email_delivery:
    delivery_method: :smtp
    smtp_settings:
-   tls: true
+   enable_starttls_auto: true
    address: "smtp.gmail.com"
    port: 587
</pre>
```

Solved my problem, I'm closing the issue.
