

ChiliProject - Bug # 1248: Routing issue

Status:	Closed	Priority:	Normal
Author:	kwadronaut .	Category:	User interface
Created:	2013-03-13	Assignee:	Holger Just
Updated:	2013-03-15	Due date:	
Remote issue URL:			
Affected version:	3.7.0		
Description:	Hi, Yesterday I had a funny issue where the name of a colleague appeared at the top right name when I mistyped an address. Our chili instances lives at https://fqdn/code/ and I wanted to read an issue so typed https://fqdn/code/1111 instead of https://fqdn/code/issues/1111 When I clicked his name I *did* arrive to the correct user (me), so I presume that link (https://fqdn/code/users/number) was correct. I couldn't reproduce this on our own tracker. I tried this on chiliproject.org and it looked similar: when visiting https://fqnd/1237 I got a 404 that looks localized in some language I don't speak, but maybe the top right says 'sign in?' On refresh I do get the localized version I prefer, but apparently it thinks I'm not logged in. When changing the url, it notices again that I was logged in. See also the screenshots. Assigning to Holger Just as discussed on irc.

Manually apply basic before_filters in case of routing error #1248

History

2013-03-15 03:18 pm - Holger Just

- Category set to User interface

- Affected version set to 3.7.0

- Target version set to 3.8.0

- Status changed from Open to Closed

The basic before filters where not applied properly when catching an @ActionController::RoutingError@ (which then renders a 404) as Rails obviously doesn't call a controller action in this case but fluke out before. We now manually call these before filters and ensure we have the correct user and localization at hand.
