

ChiliProject - Bug # 1253: CSS support for Subscript and SuperScript Textile syntax absent

Status:	Open	Priority:	Low
Author:	Ciaran Jessup	Category:	Text formatting
Created:	2013-03-19	Assignee:	
Updated:	2013-03-19	Due date:	
Remote issue URL:			
Affected version:			
Description: On Chilliproject 3+ it seems that the reset-css removes the standard user-agent CSS rules for positioning superscript and subscript inline elements, e.g. the following markup: <pre><pre>Sub ~1~ Super ^2^</pre></pre> When written directly: Sub ~1~ Super ^2^ Generates the correct markup, but the CSS that is applied does not have the expected visual effect (*1* expected that the subscript text to be slightly smaller and offset vertically downwards from the surrounding text, and similar the super-script to be displaced vertically upwards) Is this the expected behaviour (i.e. are these visual hints deliberately discarded) would a patch be welcome/accepted?

Fixed: using "*" as keyword for repository referencing keywords doesn't work when issue id is at the beginning of a line (#1253).
