Affected version:			
Description: I want to suggest a _Release_ feature. With _Release_ I denote a mapping from a name to a set of projects with a specific version. For example lets assume chiliproject instance has three projects: *p1*, *p2* and *p3* with versions: *p1_v1*, *p1_v2*, *p2_v1*, *p2_v2* and *p3_v1*. A _Release_ might be named *R1* and consist of project *p1* with version *p1_v1* and project *p2* with version *p2_v1*. Another (subsequent) Release might be named *R2* and consists of project *p1* with version *p1_v2* and project *p2* with version *p2_v1* and *p3* with version *p3_v1*. Needed features: * Create a new _Release_ (with at least its name) It would for subsequent releases be of great advantage to be able to copy from a previous one. * Assign projects to a _Release_ A _Release_ should be able consist of an arbitrary number of projects. Each project must be assigned with exactly one of its own configured versions. * Query a _Release_ It should be possible to query a release (instead of a project). For example it should be possible to get a list of all open bugs of *R1* * Advanced features More advanced features like having a roadmap for a feature would be nice ;-)
