

ChiliProject - Bug # 524: Encoding of user input

Status:	Duplicate	Priority:	Low
Author:	Gary Verhaegen	Category:	
Created:	2011-07-15	Assignee:	
Updated:	2011-07-15	Due date:	
Remote issue URL:			
Affected version:			
Description: Yet another encoding problem from using ruby 1.9: rails 2.3.x considers user input as byte strings, in particular the content of the params hash, which yields an Encoding error every time an input string is concatenated to an existing string. The fix described "there": http://jasoncodes.com/posts/ruby19-rails2-encodings fixed it for me, with the obvious change of 2.3.10 to 2.3.12. Note: this fix assumes that the user wants to use UTF-8 as the default encoding, which I believe is a reasonable default.
