- Target version set to Public Launch

2011-01-13 12:37 am - Felix Schäfer

Any specific reason for having the canonic address be www? I try to avoid it where I can.

- Status deleted ()

I setup a new virtual host in @/etc/apache2/sites-enabled/000-default@ which is a catch-all virtual host. So everything which is not gathered by any other virtual host is handled by this one.

It then just redirects every request to @https://www.chiliproject.org/\$1@ via HTTP 301.

@all: Please confirm that this is enough and close or amend the issue accordingly.

- Assignee changed from Muntek Singh to Eric Davis

- Status set to In Progress

This will conflict with the work I'm doing in #50. Moonshine automatically sets all of that up, I was manually editing the configuration to debug the symlink error.

This is why I like to use moonshine, all of the edits are tracked and we aren't conflicting with each other.

- Status changed from In Progress to Closed

I stopped working on the staging server and just added this to the production server.

This rewrite rule is in the main host's configuration in moonshine (ssl/vhost_extra) and will redirect all pages to the HTTPS www .org version (comments mine):

```
<pre>
RewriteEngine On
RewriteCond %{HTTP_HOST} !^www.chiliproject.org$ [NC]    # All hosts that aren't https://www.chiliproject.org...
RewriteRule ^(.*)$ https://www.chiliproject.org$1 [R=301,L] # ...redirect to https://www.chiliproject.org
</pre>
```
