**Remote issue URL:**

**Description:** We need a proper SSL certificate to at least secure passwords over the wire. I would prefer to secure everything.

We could use either

- \* a free "StartSSL":<https://www.startssl.com> certificate for the single domain (www.)?chiliproject.org, or
- \* a multi-domain/wildcard certificate (49\$ / 2 years).
- \* something other (probably more expensive, unless someone has any free/included certificates left)

In the seconds case, we would need to decide on the actual domains beforehand. If in doubt, I would vote for the multi-domain certificate.

### History

**2011-01-13 02:48 pm - Eric Davis**

I think we just need one for the main domain (www).

**2011-01-13 04:48 pm - Felix Schäfer**

- Assignee changed from Muntek Singh to Felix Schäfer

- Subproject of deleted (#50)

- Status set to In Progress

A certificate for (www.)?chiliproject.org is requested at StartSSL, the process has been chose for some extra verification though, waiting for a mail from them.

**2011-01-15 06:51 am - Felix Schäfer**

- Status changed from In Progress to Closed

I got the certificate and transferred the certificate and the corresponding key to Muntek/on the staging server.
