Please shortly describe your installation steps until then: Do you have bundler installed? Have you installed the provided bundle? Do you use stock ruby or another one? With rvm or plain? Do you use the ubuntu gems or did you roll your own gemset?

**2011-09-07 03:17 am - Justin Geibel**

- *Target version changed from 2.2.0 to 2.3.0*

Daniel,

Do you have any plugins installed? This part of the code is searching `./vendor/plugins/*/Gemfile` and including any gems needed by the plugin. With a default install, I have no additional Gemfiles under vendor.

You are probably using a plugin that expects to be loaded as a gem (rather than via a copy in `/vendor/plugins`).

You're right. It was the ReCaptcha plugin thats again not compatible with chiliproject :(

I'm trying to update redmine\_recaptcha to work with ChiliProject and running into this problem. If anyone has a tip or resource on converting gem plugins to compatible plugins, I'd appreciate it.

**2011-10-26 05:18 pm - Felix Schäfer**

Shane, Justin already made out a possible cause for the problem:

Justin Geibel wrote:

Anyway, this issue is closed and not the right place to ask for help with this.

The plugin author/maintainer would be most apt to help you with this, you might find help on the forums, but as it's not part of ChiliProject core, we won't support it through issues here, sorry.
