

ChiliProject - Task # 62: Associate ChiliProject issues with Redmine issues

Status:	Closed	Priority:	Normal
Author:	Eric Davis	Category:	ChiliProject - Organization
Created:	2011-01-13	Assignee:	Eric Davis
Updated:	2011-01-21	Due date:	
Remote issue URL:			
Description:	We will need some way to say "ChiliProject issue #1 is Redmine.org issue #5000". I'm thinking a custom field with the urls would be easiest, called "Remote issue id". That way we can also link issues to other bug trackers like Debian or Rails.		
	Thoughts?

How about a slightly adapted version of https://github.com/edavis10/redmine_simple_support? That way, we could actually have real links.

+1

I think providing special fields to frequent external sources is a great idea.

I use `redmine_simple_support` and wouldn't recommend it for us:

- * there is a bug preventing it from being set on new issues. Caused by Redmine and it's `@Issue#safe_attributes@` (which will be fixed eventually)
- * changes to that field are not logged into journals

If we start with a custom field, we can migrate to this plugin later. I'm going to write a migration script for myself anyways (Custom Field -> Simple Support urls).

- Status set to *Closed*

I added a Remote Issue Url field that we can use. Later on when we add a URL custom field type we can have it automatically link. (I have a prototype version that is almost ready)
