<b>Affected version:</b> 2.0.0			
<b>Description:</b> @journal_formatter.rb#default_formatters@'s named_association option is hard coded to use the record's name. Either we need to provide some way to configure this to use another field or document that it is a required as part of AAJ's API.  Thinking documenting it would be best and allow the most configurability:  AAJ consumer examples: <pre><code class="ruby"> # model uses the subject field def name subject end  # Custom method to block based on permissions def name if allowed_to?(...) name else "You cannot see the real name" end end </code></pre>
