In my opinion the best way to do this is to have a file attachment section in the Admin panel (under Settings > Design or similar). This would be saved (Attachment object without a Project perhaps?) which would then become public at a specific constant url (/images/logo). A Rails route/controller could then be used to load the Attachment object for the user.

An easier option would be to save the uploaded file into public but I don't think that would work because:

/public is read-only in some environments

we'd need to make the url constant for the CSS (#top-menu, #account) or generate the CSS dynamically. (think if the CSS points to a PNG image but a user uploads a JPEG).
