ChiliProject - Feature # 700: Accessibility: Tabindex

Status:	Open	**Priority:**	Normal
Author:	Romano Licker	**Category:**	User interface
Created:	2011-11-15	**Assignee:**	Romano Licker
Updated:	2011-12-10	**Due date:**	

Remote issue URL:	
Affected version:	unstable
Description:	The application needs to have a logical tab order.
	Disabled people use the tab-key in order to navigate through the application.
	However giving each single element (which can have a focus) a tabindex would do more harm than good. If a new element is added to the application, lets say a checkbox, and the author does not give a correct tabindex, the checkbox would be the last element reachable.
	Currently there are some elements having a tabindex and destroying the document tab-order completely (some are in the jstoolbar.js).
	I will now try to remove all tabindex and figure out, if the taborder is than logical and accessible.
	Im working on new_design/ticket/692/new-design-for-review + pull request - if someone has objections - feel free to contact me.

History

2011-11-16 10:27 am - Romano Licker

- Assignee changed from Romano Licker to Eric Davis

I completed the work.

What to do now?

I worked on the branch eric used for his pull request.

I can open a pull request for that branch but that wouldn't be a logical order. Should I do it anyway?

One commit is dependent on the new design - i could extract the rest - but than we would have one loose commit.

Suggestions?

- Target version deleted (3.0.0)

Feel free to send a pull request based on the unstable branch. Once it's reviewed I'll be able to decide which version it should fit in.

Removing from 3.0. Reason: no public code and approaching 3.0 feature freeze.
