

ChiliProject - Feature # 738: Option to automatically watch things I've interacted with

Status:	Open	Priority:	Normal
Author:	Felix Schäfer	Category:	
Created:	2011-11-29	Assignee:	
Updated:	2011-12-02	Due date:	
Remote issue URL:			
Affected version:			
Description:			
I often find that I'd like to automatically watch things I've "interacted" with, interaction being either that I've been assigned to it, that I've responded to a thread, and so on. Some parts of ChiliProject do that automatically (e.g. forums) without an option to deactivate it, while others don't do that (issues, wiki, news, etc.) but don't offer an option to activate that.			
A first iteration could have a setting for all modules, while we could make it more fine-grained by providing a means to activate it for certain modules only.

I like the idea but I'd like to see how it would be implemented. I want to keep the configuration for each user as simple as possible, we already have way too many buttons and dials in my opinion.

This is also related to what you proposed in #193. In fact, #193 might be a subset of this issue since reporting an issue is a type of interaction.

It is indeed.

I think ideally it would replace/supersede the current config with some of the same options: Auto-watch everything, things I interact with, only things I create, nothing. That could be refined per-module (e.g.: everything I interact with on forums, but just when I'm assigned the issue on issues) (the modules could provide a settings partial themselves), and I think the project-specific settings/overrides should go into the projects instead of having everything crammed in one view (that's probably a separate issue though).
