| Remote issue URL: | | | |
| Affected version: | | | |
| Description: | | | |
| The current issues filter page uses javascript to build up complex search conditions and then ajax to refresh the issue list when you click 'Apply'. | | | |
| As a result of this the URL doesn't change. Your session remembers your current "custom filter" if you click _Issues_ again, but you can't: | | | |
| * Copy and paste the URL to share a customer filter with a colleague | | | |
| * Conveniently use two different custom filters in two tabs working simultaneously | | | |
| * Use the back button to return to custom filtered views | | | |
| * Bookmark custom filters produced in this way | | | |
| For me, it would be greatly preferably if clicking the "Apply" button caused a standard GET form submission which resulted in a URL embedding the search criteria in query parameters. This URL would be copy-pastable and work well in bookmarks and browser history. | | | |
